

Week 2 day 1 assignment :

Try prompting using TL;DR and ELI-15 and observe the difference in output.

1. Embedding vector ,TL;DR: A **list of numbers that represents meaning**, so AI can compare and find similar content.
2. How to create the ai agent in co-pilot : **Create AI Agent in Copilot — TL;DR:**
 Open **Copilot Studio** → **Create agent** → Add **knowledge (docs/sites)** → Set **instructions & actions** → **Test** → **Publish** 

For ELI-15,

Create AI Agent in Copilot — ELI-15

Imagine you're building your own **smart helper** for school or work.

How you do it

1. **Open Copilot Studio**
 Like opening a game builder or app builder
2. **Tell it what job to do**
 Example: “Help answer customer questions”
(You're giving it a role like hiring a person)
3. **Give it study material**
 Add documents, websites, or notes
(This is how it learns what to answer)
4. **Tell it how to behave**
 Like: be polite, short answers, or detailed
(This is its personality)
5. **Give it powers (actions)**
 Example: send emails, create tickets
(So it can *do* things, not just talk)
6. **Try it out**
 Chat with it and see if it works
7. **Publish it**
 Now others can use it in Teams or apps

Software Testing — ELI-15 🙋

Think of **software testing** like checking your homework before submitting it.

💡 Simple idea

You built an app or website. Now you need to **make sure everything works properly** before real users use it.

📱 Example

Imagine you made a **food delivery app**:

- You tap “Order” → does it place the order? ✅
- You enter wrong address → does it show an error? ✅
- Payment fails → does it handle it correctly? ✅

👉 Testing means trying all these cases to see if something breaks.

🎯 Why do it?

- To **find mistakes (bugs)** 🐛
 - To make sure users don’t face problems 😊
 - To make the app smooth and reliable 🚀
-

✅ Easy one-liner

👉 Software testing = **checking an app carefully to make sure it works without problems before users use it.**
